I'm trying to design a multi-threaded solution and I'm trying to understand what the benefit of having threads that are "overlapped" vs "dynamic" threads (eg. only one thread is running). For example, would this be considered a "dynamic" thread: using System; using System.Threading; class Program { static void Main(string[] args) { Action action = new Action(print); new Thread(action).Start(); Console.ReadLine(); } static void print() { Console.WriteLine("This is the print method"); } } As opposed to this being a "dynamic" thread? class Program { static void Main(string[] args) { Action action = new Action(print); new Thread(action).Start(); Console.ReadLine(); } static void print() { Console.WriteLine("This is the print method"); } } Do you need one that's "overlapped" to prevent multiple instances from running at the same time? EDIT: The reason I'm asking is because I can think of scenarios where it might be useful to be able to run multiple instances of the same action at the same time, and I'd like to understand if it's worth me designing things so that they're "dynamic" rather than "overlapped".
