Photoshop CS6 offers other new tools to handle background removal. You can now digitally remove large areas of background or even the whole background if you use the eraser tool. The removal is intelligent; the program recognizes when the background content overlaps the foreground and is invisible.

The new crop tool automatically crops and resizes photos for you. When you are ready, select the "Create New Version" icon in the lower-right corner of the viewport. During the crop, previewing will show you lines that are invisible to the crop tool.

There are many improvements in the text tools and speech balloons. You can now measure and resize speech balloons in your documents. The text tools have many improvements, including the ability to draw lines and text boxes along paths. Such a feature is particularly useful for drawing telephone poles and other structures in the foreground of a landscape photograph.

Another improvement in Photoshop CS6 is the ability to work with WYSIWYG web page viewers, a la HTML5. Thanks to Twitter's HTML5 help page (www.html5help.com), if you visit a web page with support for CSS3 grid layouts, Photoshop will design your page for you. It likely trims the page to the minimum size a browser will support. However, no elements that try to extend beyond the borders of the page will fire CSS3 animations or other web page-specific events.

The program's applied filters and retouch tools have been improved. Photoshop CS6 has the ability to apply four different types of filters in one operation, including four-color "quad-luminance" filters. Filters are smart enough not to turn a photo into a Grunge photograph.

Introducing Sensei AI - Photoshop. With powerful AI machine and deep neural network technology, Adobe Sensei AI (AI stands for artificial intelligence) deep learning engine significantly speeds up the error-prone process of correcting selections, removing unwanted objects in an image, and applying other edits. Adobe Sensei AI is also available for various video apps, including Adobe Premiere Rush and Adobe VEVO - Learn more at Adobe. Introducing Scripts. Scripting Photoshop has been a powerful way to automate repetitive tasks, but it is currently not possible to script actions across applications. Scripts help solve this fundamental problem. The new Scripts feature enables Photoshop users to use scripts across all applications to automate time-consuming processes for common photographic scenarios, such as combining multiple shots into panoramic images or blending multiple layers into one. Scripts can also be triggered when elements are added to a document (import, selection, adjustment layers, etc.). Introducing Smart Sharpen. Lately, Photoshop has been blacking out the details when it sharpens a photo. With smart sharpen, the deeper the details in an image, the better the quality of sharpening. Smart Sharpen takes into account the sharpness of the details and increases the tolerance for blurriness, thus achieving the best quality when sharpening images with complex details—such as those taken in low light or with a long focal length. When combined with accurate image noise reduction, the result is amazing.
